1. Introduction

As in the previous years we hereby want to report on our plant collecting activities in 2004 and their results. By that we want to inform all partners and contributors to Flora Hellenica what additional plant material from which regions of Greece is now available in Botanical Museum Berlin-Dahlem. This material will hopefully be used for an updating of the published two volumes of Flora Hellenica and for the elaboration of the future volumes.

In 2004 we have been able to stay 29 days in Greece from April 30th to May 28th. After careful study of our own field records and the distribution maps published in the 1st volume of Flora Hellenica we concentrated on those low and middle altitude areas between the mountains of Gramos, Vernon, Voras, Vermion and Paikon close to the border to Albania and Macedonia, mainly in the Nomi of Kastoria, Florina, Pella and Kilikis. These regions seemed to be undervisited and undercollected hitherto. Localities of our collection are shown in the following map.

303 localities have been visited, 105 of them below 500 m, 101 between 500 and 700 m, 73 between 70 and 100 m and 24 above 1000 m. In consequence more than 40 % of visited localities have been farmland and surrounding biotopes.

As in the previous years we have planned our daily collection on base of 10 x 10 km-UTM-squares. Within these we selected typical topographical sites and biotopes and tried to collect all species flowering and fruiting as far as they had been seen and identified by us. At second and third collection points within the same square we tried to avoid doublings.

March and April 2004 must have been very rainy in Northern Greece. May 2004 was characterized by moderate temperatures, between 12 and 16,5 °C in the morning and 22-28 °C maximum, the most days slightly cloudy and very sunny, only very few days rainy but with a lot of raining over night. Thus the conditions even on stony and eroded hillsides have been extremely good, all biotopes have been green and colourful from the broad range of well-developed plants. On many days we had to stop collecting in the mid afternoon because our presses had been overfilled.

As in the past years we used 6 presses each of them calculated for approximately 50 plants, this means an overall capacity of 300 plants per day. Actually we collected on 19 (of 28) days between 330 and 360 plants. For optimal use of the available capacity of the six presses we

had to place in each press between 8 and 12 times two plants between the corrugated board instead of the normal 1 plant. This did not cause any qualitative problem. The reason is that we optimised again the used combination of C-line (3,2-3,9 mm) and B-line (2,2-3,0 mm) corrugated board. Over night we used a continuous change of B- and C-line corrugated board. The drying result over night was such good, that the remaining number of slightly wet plants in the morning had been approximately 30-50 specimen only. After rainy days, having collected really wet plants, the remaining number of slightly wet plants could increase up to 100 plants.

To replace dried material it is necessary to open the presses in the morning, to select dried plants, to remove tissue material for example from big-flowering *Verbascum* and in some cases to turn plants by 180 °. Time consumption for the morning inspection is in the range of 12-15 minutes for each press. The drier the plants the less time is needed for controll. For the further drying it is absolutely necessary to use a different combination of corrugated board using 2 B-line followed by 1 C-line and, additionally taking out one of the four infra-red lamps. These measures are necessary to avoid negative high temperatures.

Using this technique quality and especially colour of dried plants, even if they filled the whole paper surface, has been astonishing even.

It has proved positively to underlay and to cover the flowers of some species like *Papaver*, *Glaucium*, *Helianthemum*, *Verbascum*, *Linum* with one line of tissue. These tissues should be removed after 8-10 hours drying (not really necessary for *Papaver* and *Rosa*).

All plants are mounted labelled and, as far as possible, determined by ourselves. The labels contain the following informations:

Sheet-No.:
Family:
Species:
State, Nomos, Locality, Date
Biotope, Altitude
Short-cut of Locality, UTM, Greenwich
Collectors: Sheet-Numbers of this
Locality

The determination helps us very much to improve the collection process. Though we are no botanists we try to determine the plants at least until level of genus including all failures an amateur is able to do. We hope to minimize determination mistakes as far as possible and hope that all users will excuse our poor knowledge. For our own quality control it is very important that our plant sheet will be gone through, confirmed or corrected by specialists.

Determined species are added to our access data-base and finally delivered to the herbarium of the Botanical Museum Berlin-Dahlem. Here they are waiting for the necessary scientific assessment.

Cerastium brachypetalum

In Botanical Museum Berlin-Dahlem are 360 sheet of *Cerastium brachypetalum* in such a quality that they could be easily determined by a professional botanist. It can't be understood that this has not been done for Flora Hellenica Vol. 1. Now we have tried to break them down to the different subspecies.

Cerastium brachypetalum* subsp. *pindigenum

Cerastium brachypetalum* subsp. *roeseri

Ceratocephalus falcatus

The species is generally overlooked because of his early flowering. It seem to have very specific biotope demands. In cornefields with stronger use of herbicides it seems to be absent. But even in those with less use of chemicals, in which *R. arvensis* or *Agrostemma githago* are abundant it seems to be absent if the soil conditions. The correlation should be studied.
