1. Introduction

As in the previous years we hereby want to report on our plant collecting activities in 2005 and their results. By that we want to inform all partners and contributors to Flora Hellenica on the recently collected plant material and on the visited regions of Greece. The plant collection is now available in Botanical Museum Berlin-Dahlem. This material will hopefully be used for an updating of the published two volumes of Flora Hellenica and for the elaboration of the future volumes.

In 2005 we have been able to stay two times in Greece, from May 4th to June 2nd and from September 21st to October 18th. This second part of the yearly report covers our excursion in September and October 2005.

In autumn we visited parts of Ahaia, Etolia-Akarnania, Fokis and Viotia, close to the coast line of Korinthiakos Kolpos, stayed for the first time on Evvia and revisited localities in Fthiotis and Evrytania.

Localities of springtime and autumn collections are shown in the following map.

Fig. 1: Localities visited in year 2005

Regions southern and northern of Korinthiakos Kolpos as well as the the south-eastern part of Evvia had been rather dry and poor of flowering and fruiting plants. Conditions in the central and north-western part of Evvia, the northern part of Fthiotis and in Evrytania had been much better. In comparison with autumn 2001 and 2003 this was the driest of our autumn seasons, but maybe the normal one.

In autumn 2005 313 localities have been visited. As can be seen in the following figure the majority has been between sea-level and 350 m.

fig. 2: Vertical distribution of localities visited in autumn 2005

As in the previous years we have planned our daily collection on base of 10 x 10 km-UTM-squares. Within these we selected typical topographical sites and biotopes and tried to collect all species flowering and fruiting as far as they had been seen and identified by us. At second and third collection points within the same square we tried to avoid doublings.

As in the past years we used 6 presses each of them calculated for approximately 50 plants, this means an overall capacity of 300 plants per day. Actually we collected on 19 (of 28) days between 330 and 360 plants. For optimal use of the available capacity of the six presses we had to place in each press between 8 and 12 times two plants between the corrugated cardboard instead of the normal 1 plant. This did not cause any qualitative problem. The reason is that we optimised again the used combination of C-line (3,2-3,9 mm) and B-line (2,2-3,0 mm) corrugated cardboard. Over night we used a continuous change of B- and C-line corrugated board. The drying result over night was such good, that the remaining number of slightly wet plants in the morning had been approximately 30-50 specimen only. After rainy days, having collected really wet plants, the remaining number of slightly wet plants could increase up to 100 plants.

To replace dried material it is necessary to open the presses in the morning, to select dried plants, to remove tissue material for example from big-flowering *Verbascum* and in some cases to turn plants by 180 °. Time consumption for the morning inspection is in the range of 12-15 minutes for each press. The drier the plants the less time is needed for controll. For the further drying it is absolutely necessary to use a different combination of corrugated board using 2 B-line followed by 1 C-line and, additionally taking out one of the four infra-red lamps. These measures are necessary to avoid negative high temperatures.

Using this technique quality and especially colour of dried plants, even if they filled the whole paper surface, has been astonishing even.

It has proved positively to underlay and to cover the flowers of some species like Papaver, Glaucium, Helianthemum, Verbascum, Linum with one line of tissue. These tissues should be removed after 8-10 hours drying (not really necessary for Papaver and Rosa).

All plants are mounted labelled and, as far as possible, determined by ourselves. The labels contain the following informations:

Sheet-No.:
Family:
Species:
State, Nomos, Locality, Date
Biotope, Altitude
Short-cut of Locality, UTM, Greenwich
Collectors: Sheet-Numbers of this Locality

The determination helps us very much to improve the collection process. Though we are no botanists we try to determine the plants at least until level of genus including all failures an amateur is able to do. We hope to minimize determination mistakes as far as possible and hope that all users will excuse our poor knowledge. For our own quality control it is very important that our plant sheet will be gone through, confirmed or corrected by specialists.

Determined species are added to our access data-base and finally delivered to the herbarium of the Botanical Museum Berlin-Dahlem. Here they are waiting for the necessary scientific assessment.
