1. Introduction

As in the previous years we hereby want to report on our plant collecting activities in 2007 and their results. By that we want to inform all partners and contributors to Flora Hellenica on the recently collected plant material and on the visited regions of Greece. The plant collection is now available in Botanical Museum Berlin-Dahlem. This material will hopefully be used for an updating of the published two volumes of Flora Hellenica and for the elaboration of the future volumes.

In 2008 we have been from April 6th to May 5th in Central Greece, mainly in the prefectures of Trikala, Karditsa, and Larisa, with few excursions to Grevena, Kozanis, Fthiotis and Magnisia. It was our idea to have a first look at the spring-time flora in Larisa and the Plane of Thessaly and by that to blacken a little bit some white areas in most published distribution-maps.

We started in the plane of Karditsa - from the north-eastern slopes of South Pindus to the mountains of Titanos (693 m) and Fyllion Oros (533 m), the natural border between Karditsa and Larisa. The plane is mostly used for agriculture and pastures, traversed by drainage ditches. Only a few lower stony hills may be found, most of them surrounded by agricultural sites and difficult to access but nevertheless overgrazed by sheep and goats. Therefore the most visited biotopes have been herbaceous areas between roads and cropfields or pastures, along drainage ditches and embankments. Oakwoods, pinewoods, deciduous trees are rare. In consequence, the flora is very homogeneous, not rich of specialities and not interesting for professional botanists. But maybe the collection contains some minor varieties for splitting experts.

The most time we stayed in the plane of Larisa (Thessaly) with some excursions to the valley of Xirolakkos between Higher and Lower Olympos, to the northern and southern slopes of Lower Olympos, to the southern and western slopes of Ossa and Mavrovouni in the North-East and to the hills around Farsala and Domokos in the South.

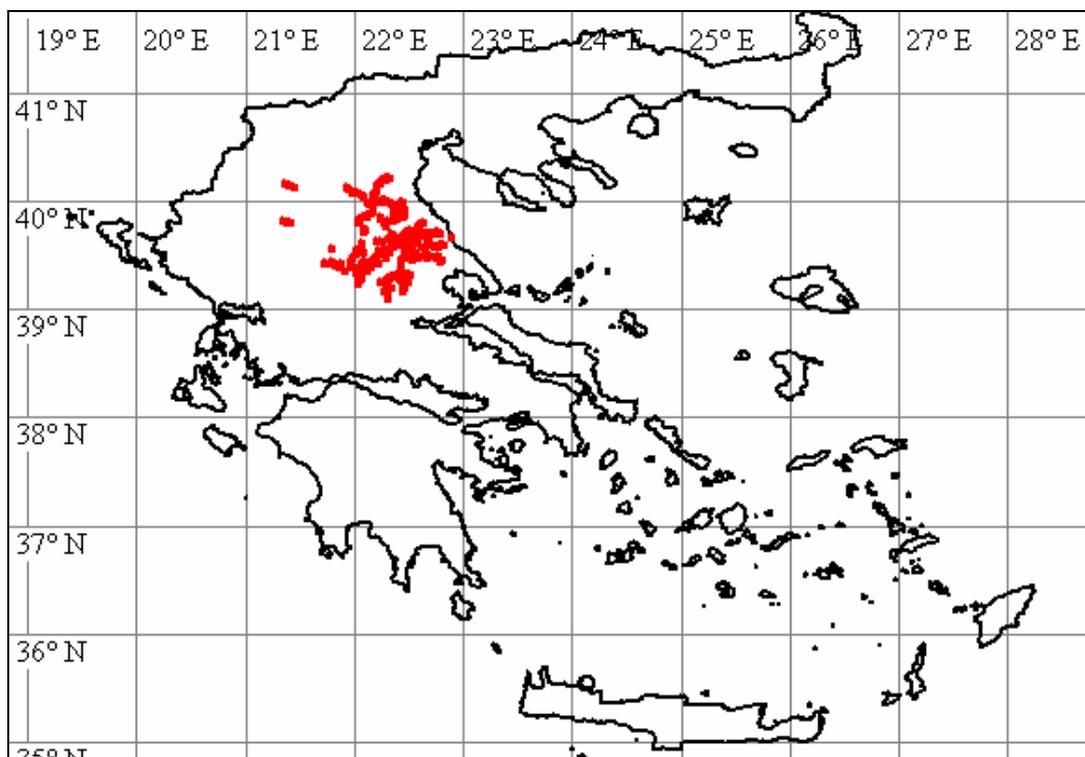

Fig. 1: Localities visited in year 2008, general survey

The real flat area (60-90 m) is relative small, mostly from Larisa to the South east and along the river to the North. Only some 10-20 km to the west, south, east and north of Larisa the plane is replaced by hilly structures. The top and the most slopes of these hills are used agriculture, but there are a lot of slopes unused, some of them stony with smaller Oak- and Pine-woods and most of them not or less grazed.

In contrary to the plane of Karditsa even the agricultural areas look very colourfull. The reason is, that nearly all roads have a 2 - 4 m broad strip between road and crop-fields not used and not very much influenced by agricultural chemicals. It looks like an official program to save by these strips the original nature between traffic and food production.

Visited localities and their allocation to the road-net are shown in the following map:

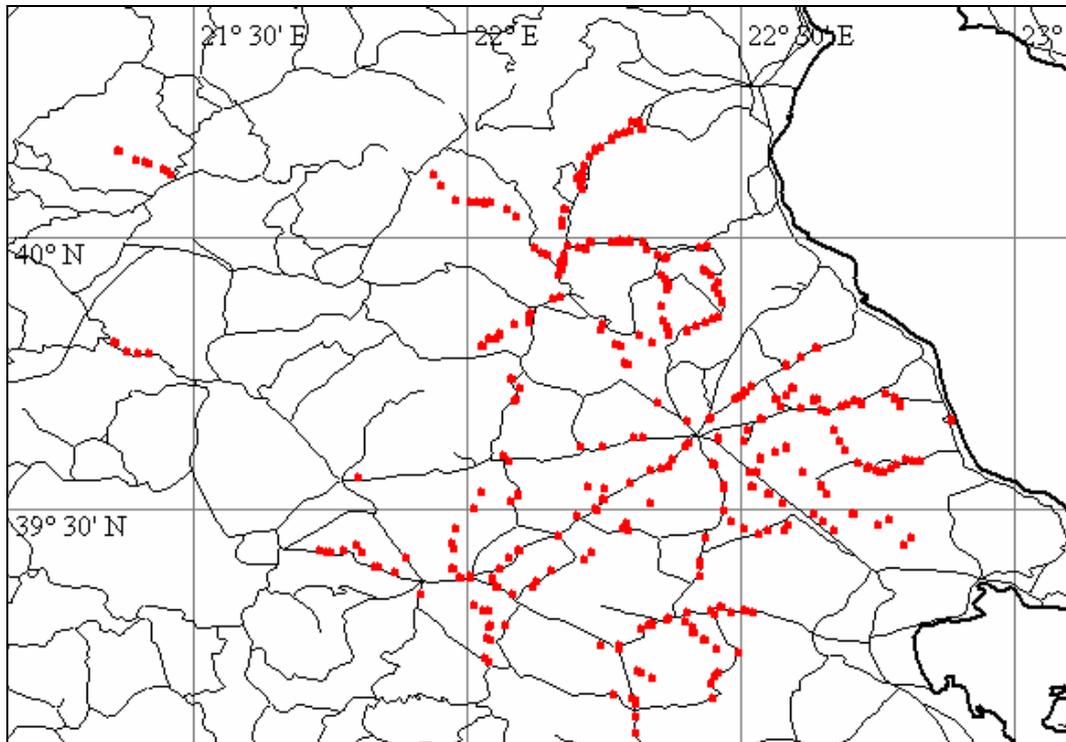

Fig. 2: Localities visited in year 2008, closer look

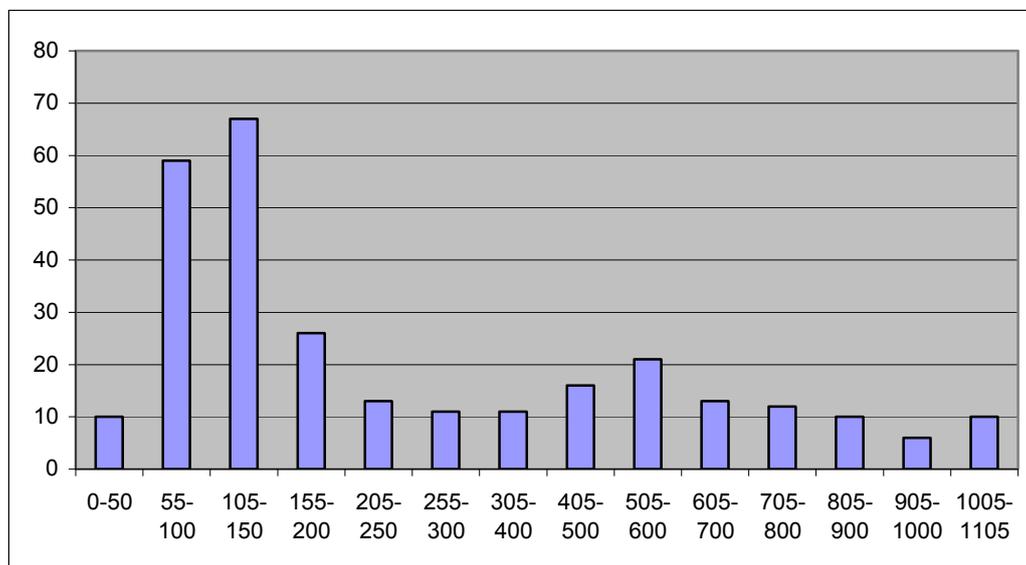

Fig. 3: Vertical distribution of localities visited in spring 2008
Number of visited localities on height (m)

Because of the rich and various structure of the landscape and its biotopes it seems to be absolutely appropriate and necessary to revisit the same area four to six weeks later and in autumn. This may be very clear from the following table. 10 x 10 km-squares of UTM-squares EK, FK, EJ and FJ contain the number of species collected by us. All squares with less than 250 species have been

visited one time only. Squares like EJ 39 (surrounding of Kastanea in South Pindus) with 640 species have been visited 2 or three times.

A still existing problem is the illegal and uncontrolled disposal of waste less in Larisa, much ore in Karditsa and Trikala. It is not allways used tyres as shown in the following picture, but mostly

bulky waste, especially from construction and demolition that is disposed at places not suitable for agricultural or other economical use.

23.4.08 SW Farsala

We have planned our daily collection on base of 10 x 10 km-UTM-squares. Within these we selected typical topographical sites and biotopes and tried to collect all species flowering and fruiting as far as they had been seen and identified by us. At second and third collection points within the same square we tried to avoid doublings. All plants have been collected by Rita & Eckhard Willing.

As in the past years we used 6 presses each of them calculated for approximately 50 plants, this means an overall capacity of 300 plants per day. Actually we collected on 19 (of 28) days between 330 and 360 plants. For optimal use of the available capacity of the six presses we had to place in each press between 8 and 12 times two plants between the corrugated cardboard instead of the normal 1 plant. This did not cause any qualitative problem. The reason is that we optimised again the used combination of C-line (3,2-3,9 mm) and B-line (2,2-3,0 mm) corrugated cardboard. Over night we used a continuous change of B- and C-line corrugated board. The drying result over night was such good, that the remaining number of slightly wet plants in the morning had been approximately 30-50 specimen only. After rainy days, having collected really wet plants, the remaining number of slightly wet plants could increase up to 100 plants.

To replace dried material it is necessary to open the presses in the morning, to select dried plants, to remove tissue material for example from big-flowering *Verbascum* and in some cases to turn plants by 180 °. Time consumption for the morning inspection is in the range of 12-15 minutes for each press. The drier the plants the less time is needed for controll. For the further drying it is absolutely necessary to use a different combination of corrugated board using 2 B-line followed by 1 C-line and, additionally taking out one of the four infra-red lamps. These measures are necessary to avoid negative high temperatures.

Using this technique quality and especially colour of dried plants, even if they filled the whole paper surface, has been astonishing even.

It has proved positively to underlay and to cover the flowers of some species like Papaver, Glaucium, Helianthemum, Verbascum, Linum with one line of tissue. These tissues should be removed after 8-10 hours drying (not really necessary for Papaver and Rosa).

All plants are mounted labelled and, as far as possible, determined by ourselves. The labels contain the following informations:

Sheet-No.:
Family:
Species:
State, Nomos, Locality, Date
Biotope, Altitude
Short-cut of Locality, UTM, Greenwich
Collectors: of this Locality

The determination helps us very much to improve the collection process. Though we are no botanists we try to determine the plants at least until level of genus including all failures an amateur is able to do. We hope to minimize determination mistakes as far as possible and hope that all users will excuse our poor knowledge. For our own quality control it is very important that our plant sheet will be gone through, confirmed or corrected by specialists.

Determined species are added to our access data-base and finally delivered to the herbarium of the Botanical Museum Berlin-Dahlem. Here they are waiting for the necessary scientific assessment.

2. Localities

Within the list of localities we have added pictures showing the concrete locality or the typical landscape around it.
